

SAFETY DATA SHEET prepared in accordance with Regulations 1907/2006/CE – (EC) 2020/878

FIBRANgyps Q25

date of revision: 30/06/2021

1 Identification of the substance/mixture and of the company/undertaking

- 1.1
 Product identifier, trade name

 FIBRANgyps Q25
 Unique Formula Identifier UFI: KK80-J0HP-A00X-TFSA
- **1.2** Relevant identified uses of the substance or mixture and uses advised against Gypsum based smoothing plaster. Identified uses: Professional.
- 1.3 Details of the supplier of the safety data sheet FIBRAN SpA Loc. Poggio Ulivi – 58036 Roccastrada (GR) – Italy Tel: +39(0)564 577022 Fax: +39(0)564 577400 e-mail address of the competent person responsible for the SDS: info@fibran.it
- **1.4 Emergency telephone number** For urgent inquiries refer to your NATIONAL POISONS INFORMATION SERVICE

2 Hazards identification

2.1 Classification of the mixture

2.1.1 Classification according to Regulation (EC) No 1272/2008 [CLP].

Hazard class	Hazard category	Hazard statements
Skin irritation	2	H315: Causes skin irritation.
Serious eye damage/eye irritation	1	H318: Causes serious eye damage.
Specific target organ toxicity single exposure, respir. tract irrit.	3	H335: May cause respiratory irritation.

2.2 Label elements

Hazard pictograms:	Hazard statements: H315: Causes skin irritation.
	H318: Causes serious eye damage. H335: May cause respiratory irritation. Precautionary statements: P261: Avoid breathing dust/fume/gas/mist/vapours/spray.
Oinn al una das Dan ana	P280: Wear protective gloves/protective clothing/eye protection/face protection. P302+P352: IF ON SKIN: wash with plenty of soap and water
Signal words: Danger	 P302+P352. IF ON SKIN, wash with plefty of soap and water P304+P340: IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. P305+P351+P338: IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. P310: Immediately call a POISON CENTER or doctor/physician. P501: Dispose of contents / container in accordance with national regulations

2.3 Other hazards

On the basis of available data, the product does not contain any PBT or vPvB in percentage greater than 0,1%

3 Composition/information on ingredients

3.1 Substances – Not applicable as this product is a mixture

3.2 Mixtures - Contains:

Substance	Conc. %	EC n.	CAS n.	REACH Registration No.	Classification according to Reg. 1272/2008 (CLP)		SCL, M- Factor, ATE
Calcium Sulfate	>45	231-900-3	10034-76-1	01-2119444918-26-XXXX	Not hazardou	S	Not applicable
Calcium Carbonate	< 40	215-279-6	1317-65-3	Exempt according Annex V.7, Reg. (EC) n. 1907/2006	Not hazardou	S	Not applicable
Calcium hydrate	15	215-137-3	1305-62-0		Skin Irrit. 2 Eye Dam. 1	H315 H318	Not applicable

			SOT SE3	H335	

4 First aid measures

4.1 Description of first aid measures

General information - No delayed effects have been reported. Consult a Doctor for all routes of exposure **Eyes** - Wash immediately with plenty of water. Get medical advice/attention.

Skin - Remove contaminated clothing. Rinse skin with a shower immediately. Get medical advice/attention.

Inhalation - Remove victim to fresh air. Get medical advice/attention immediately.

Ingestion - Have the subject drink as much water as possible. Do not induce vomiting. Get medical advice/attention.

4.2 Most important symptoms and effects, both acute and delayed

Contains Calcium hydrate, which is not acutely toxic if ingested, inhaled or comes into contact with the skin. Calcium hydrate is classified as irritating to the skin and the respiratory tract, and carries the risk of serious eye damage. It can cause redness, tearing, eye irritation or corrosions, rhinitis, irritation to the upper respiratory tract, bronchitis, as well as redness, skin rash and skin corrosion. There are no fear of systemic adverse effects: the main danger to health is represented by local effects (effect on pH).

4.3 Indication of any immediate medical attention and special treatment needed See the above, if you contact a doctor, take this document with you

5 Firefighting measures

- 5.1 Extinguishing media
 - Products itself does not burn. Use extinguishing media compatible with the surrounding environment
- 5.2 Special hazards arising from the substance or mixture
- Product non-flammable, non explosive and it does not facilitate the burning of anything else
- 5.3 Advice for firefighters

Avoid generation of dust. Use extinguishing media compatible with the surrounding environment

6 Accidental release measures

- 6.1 Personal precautions, protective equipment and emergency procedures Wear suitable protective equipment to prevent any contamination of skin, eyes and personal clothing, see section 7 and 8
- 6.2 Environmental precautions

The product must not penetrate into the sewer system or come into contact with surface water or ground water.

6.3 Methods and material for containment and cleaning up If possible, retrive the product sweeping/vacuuming The product hardens in contact with water. Keep collected product away from water.

6.4 Reference to other sections

Other information is given in sections 8 and 13.

7 Handling and storage

7.1 Precautions for safe handling

Avoid contact with skin or eyes. Keep containers sealed to avoid generation of dust.

7.2 Conditions for safe storage, including any incompatibilities

Store the product indoors.

7.3 Specific end use(s)

Gypsum based plaster, see section 1.2.

8 Exposure controls/personal protection

8.1 Control parameters, Threshold Limit Value

-	Туре	Country	TWA/8h	STEL
Calcium sulphate	OSHA	USA	5 mg/m ³ dust respirable fraction	
	OSHA	USA	15 mg/m ³ dust inhalable fraction	
Calcium Carbonate	OES-TWA	GB	5 mg/m ³ dust respirable fraction	
	OES-TWA	GB	10 mg/m ³ dust inhalable fraction	
Coloium hydroto			1 mg/m ³ duct recontroble 1 m	ad/m ³ 15 min duct roop

Calcium hydrateOELEU1 mg/m³ dust respirable4 mg/m³ 15 min. dust resp.Reccommendation of the SCOEL committee (SCOEL/SUM 137 february 2008):Occupation exposure limit (OEL), 8-hour time weight average:1 mg/m³ dust respirable of calcium hydrate

Short Term Exposure Limit (STEL): 15 minutes, 4mg/mc calcium hydrate respirable dust Prodicted No Effort Concentration (RNEC) in water = 400 microar (I RNECC soil/underground water = 10

Predicted No Effect Concentration (PNEC) in water = 400 microgr./I PNERC soil/underground water = 1080 microgr./I

8.2 Exposure controls

General measures

Contains Calcium hydrate. Wear appropriate clothing and protective equipment. Do not eat or drink while using the product. Avoid contact with eyes, skin and dust dispersion.

Respiratory Protection

Contains Calcium hydrate. It is recommended to ventilate the environment. Use a type FFP filtering facemask (see standard EN 149).

Skin Protection

Contains Calcium hydrate, skin irritant. In case of hypersensitivity of the skin, use protective gloves complying with standard EN 374-2, use long-sleeved work clothes, safety shoes or boots.

Recommended glove types: Protective gloves made of nitrile rubber

thickness of the material: > 0,4 mm Breakthrough time: 10 - 30 min

Eye Protection

Contains Calcium hydrate. Do not use contact lenses. Prefer thight-fitting protective glasses with lateral protection complying with EN 166 standard.

9 Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical state	powder
Color	white
Odor	odorless
Melting point/freezing point	for calcium sulphate, main component: >1450 °C
Boiling point or initial boiling point	Not applicable, as solid state mixture under ordinary conditions
Boiling range	Not applicable, as solid state mixture under ordinary conditions
Flammability	Not applicable, as material in not combustible
Lower explosion limit:	Does not apply to solids
Upper explosion limit	Does not apply to solids
Flash point	Does not apply to solids
Auto-ignition temperature	Not applicable, only applies to gasses and liquids
Decomposition temperature	Not applicable, as not self-reactive present
рH	12 solution concentration 10%
Kinematic viscosity	Not applicable, only appliies to liquids
Solubility:	contains calcium sulphate, its solubility in water is about 2 g/l
Partition coefficient n-octanol/water:	Not applicable, as it is an inorganic mixture
Vapor pressure:	Not applicable, as melting point >1450 °C
Density and/or relative density	0,9 – 1,3 g/cm ³
Particle characteristics:	Typical average particle size: 5 – 100 μ

9.2 Other information

9.2.1 Information with regard to physical hazard classes None

9.2.1 Other safety characteristics None

10 Stability and reactivity

10.1 Reattivity

Product hardens in conctat with water. No specific material to avoid

- 10.2 Chemical stability
- The product is stable in normal conditions of use and storage
- **10.3** Possibility of hazardous reactions
 - In normal use and storage conditions, no dangerous reactions are expected
- **10.4** Conditions to avoid None. Stable when stored indoors and dry
 - None. Stable when stored indoors and dr
- 10.5 Incompatible materials Information not available
- **10.6 Hazardous decomposition products** Information not available

11 Toxicological information

11.1 Information on hazard classes as defined in Regulation (EC) No. 1272/2008 No toxicological studies have been carried out on the product. Contains Calcium hydrate, which causes serious ocular lesions, opacity of the cornea, lesions of the iris and irreversible coloring of the eye. Calcium hydrate LD50 (oral) ≥ 7340 mg/kg for rat (OECD Test Guideline 401)

11.2 Information on other hazards

12 Ecological information

12.1

Toxicity (acute)Calcium hydrateLC50 for fisch50,6 mg/l/96hLC50 for crustacea49,1 mg/l/48hEC50 for algae/Acquatic plants184,57 mg/l/72h

12.2 Persistence and degradability Information not available

12.3 Bioaccumulative potential Information not available

12.4 Mobility in soil Information not available

- 12.5 Risults of PBT and vPvB assessment
 On the basis of available data, the product does not contain any PBT or vPvB in percentage > 0,1%.
- 12.6 Endocrine disrupting properties
- Information not available 12.7 Other adverse effects
 - Information not available

13 Disposal considerations

13.1 Waste treatment methods

Keep out of drains, sewers, ditches and waterways. Disposal must be performed through an authorised waste management firm, in compliance with national and local regulations. Dispose of emptied packaging according to waste code EWC 15 01 05.

14 Transport information

The product is not dangerous under current provisions of the transport od goods Codes (IMDG, ADR, RID, IACO/IATA).

14.1 UN number

- Not applicable
- 14.2 UN proper shipping name Not applicable
- 14.3 Transport hazard class(es) Not applicable
- 14.4 Packing group Not applicable
- 14.5 Environmental hazards Not applicable
- **14.6** Special precautions for user Not applicable
- **14.7 Maritime transport in bulk according to IMO instruments** Not applicable

15 Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the mixture

This Safety Data Sheet complies with Regulation (EC) 1907/2006 – (REACH) and successive modifications **National legislation/requirements**

Italy Decreto Legislativo n. 81/2008.

Users must observe the measures of their own workplace health and safety risk assessment. Regarding personal protection devices, see Section 8

15.2 Chemical safety assessment

A chemical safety assessment has been performed for the following contained substance: Calcium hydrate

16 Other information

The data and information contained in this sheet are the result of the knowledge available at the date of publication. The company assumes no responsibility for damage to persons or property that may arise from a use of the substance other than that for which it was intended. The card does not replace, but integrates, the texts o the rules governing the user's activity. The user has full responsibility for the precautions that are necessary for the use it will make of the product. It is understood that the user must define safety measures according to the legislation applicable to its activities.

This product complies with EN 13279-1:08 Gypsum binders and gypsum plasters - Definitions and requirements

Written questions: Further information can be provided upon request, by contacting our technical service.

16.1 Indication of changes

The present revision meets the requirements according to Regulation (EU) 2020/878.

16.2 Abbreviations and acronyms

- ACGIH: American Conference of Industrial Hygenists
- ADR: Agreement on the transport of Dangerous goods by Road
- CAS Chemical Abstracts Service

EXPOSURE SCENARIOS for Ca(OH)₂

ANNEX TO THE SAFETY DATA SHEET - rev. 30/06/2019

The current document includes all relevant occupational and environmental exposure scenarios (ES) for the production and use of calcium dihydroxide (or calcium hydrate) as required under the REACH Regulation (Regulation (EC) No 1907/2006). For the development of the ES the Regulation and the relevant REACH Guidance have been considered. For the description of the covered uses and processes, the "R.12 – Use descriptor system" guidance (Version: 2, March 2010, ECHA-2010-G-05-EN), for the description and implementation of risk management measures (RMM) the "R.13 – Risk management measures" guidance (Version: 1.1, May 2008), for the occupational exposure estimation the "R.14 – Occupational exposure estimation" guidance (Version: 2, May 2010, ECHA-2010-G-09-EN) and for the actual environmental exposure assessment the "R.16 – Environmental Exposure Assessment" (Version: 2, May 2010, ECHA-10-G-06-EN) was used.

Methodology used for environmental exposure assessment

The environmental exposure scenarios only address the assessment at the local scale, including municipal sewage treatment plants (STPs) or industrial waste water treatment plants (WWTPs) when applicable, for industrial and professional uses as any effects that might occur is expected to take place on a local scale. 1) Professional uses (local scale)

The exposure and risk assessment is only relevant for the aquatic and terrestrial environment. The aquatic effect and risk assessment is determined by the pH effect. Nevertheless, the classical risk characterisation ratio (RCR), based on PEC (predicted environmental concentration) and PNEC (predicted no effect concentration) is calculated. The professional uses on a local scale refer to applications on agricultural or urban soil. The environmental exposure is assessed based on data and a modelling tool. The modelling FOCUS/ Exposit tool is used to assess terrestrial and aquatic exposure (typically conceived for biocidal applications). Details and scaling approach indications are reported in the specific scenarios.

Methodology used for occupational exposure assessment

By definition an exposure scenario (ES) has to describe under which operational conditions (OC) and risk management measure (RMMs) the substance can be handled safely. This is demonstrated if the estimated exposure level is below the respective derived no-effect level (DNEL), which is expressed in the risk characterisation ratio (RCR). For workers, the repeated dose DNEL for inhalation as well as the acute DNEL for inhalation are based on the respective recommendations of the scientific committee on occupational exposure limits (SCOEL) being 1 mg/m³ and 4 mg/m³, respectively.

In cases where neither measured data nor analogous data are available, human exposure is assessed with the aid of a modelling tool. At the first tier screening level, the MEASE tool (http://www.ebrc.de/mease.html) is used to assess inhalation exposure according to the ECHA guidance (R.14).

Since the SCOEL recommendation refers to respirable dust while the exposure estimates in MEASE reflect the inhalable fraction, an additional safety margin is inherently included in the exposure scenarios below when MEASE has been used to derive exposure estimates.

Methodology used for consumer exposure assessment

By definition an ES has to describe under which conditions the substances, preparation or articles can be handled safely. In cases where neither measured data nor analogous data are available, exposure is assessed with the aid of a modelling tool.

For consumers, the repeated dose DNEL for inhalation as well as the acute DNEL for inhalation are based on the respective recommendations of the Scientific Committee on Occupational Exposure Limits (SCOEL), being 1 mg/m³ and 4 mg/m³, respectively.

For inhalation exposure to powders the data, derived from van Hemmen (van Hemmen, 1992: Agricultural pesticide exposure data bases for risk assessment. Rev Environ Contam Toxicol. 126: 1-85.), has been used to calculate the inhalation exposure. The inhalation exposure for consumers is estimated at 15 μ g/hr or 0.25 μ g/min. For larger tasks the inhalation exposure is expected to be higher.

A factor of 10 is suggested when the product amount exceeds 2.5 kg, resulting in the inhalation exposure of 150 μ g/hr. To convert these values in mg/m³ a default value of 1.25 m³/hr for the breathing volume under light working conditions will be assumed (van Hemmen, 1992) giving 12 μ g/m³ for small tasks and 120 μ g/m³ for larger tasks.

When the preparation or substance is applied in granular form or as tablets, reduced exposure to dust was assumed. To take this into account if data about particle size distribution and attrition of the granule are lacking,

the model for powder formulations is used, assuming a reduction in dust formation by 10 % according to Becks and Falks (Manual for the authorisation of pesticides. Plant protection products.

Chapter 4 Human toxicology; risk operator, worker and bystander, version 1.0., 2006).

For dermal exposure and exposure to the eye a qualitative approach has been followed, as no DNEL could be derived for this route due to the irritating properties of calcium hydrate. Oral exposure was not assessed as this is not a foreseeable route of exposure regarding the uses addressed.

Since the SCOEL recommendation refers to respirable dust while the exposure estimates by the model from van Hemmen reflect the inhalable fraction, an additional safety margin is inherently included in the exposure scenarios below, i.e. the exposure estimates are very conservative.

The exposure assessment of calcium hydrate professional and industrial and consumer use is performed and organized based on several scenarios. An overview of the scenarios and the coverage of substance life cycle is presented in Table 1.

 Table 1: Overview on exposure scenarios and coverage of substance life cycle

ES number	Exposure scenario title		Identi	fied uses		Resulting life cycle stage	fied Use		Sctor of use category (SU)	Chemical Product Category (PC)	Process category (PROC)	Article category (AC)	Environmental release category (ERC)
		Manufacture	Formulation	End use	Consumer	Service life (for articles)	Linked to identified Use

2.1 Control of workers exposure

Product characteristic

According to the MEASE approach, the substance-intrinsic emission potential is one of the main exposure determinants. This is reflected by an assignment of a so-called fugacity class in the MEASE tool. For operations conducted with solid substances at ambient temperature the fugacity is based on the dustiness of that substance. Whereas in hot metal operations, fugacity is temperature based, taking into account the process temperature and the melting point of the substance. As a third group, high abrasive tasks are based on the level of abrasion instead of the substance intrinsic emission potential.

PROC	Use in preparation	Content in preparation	Physical form	Emission potential
All applicable PROCs	Not re	stricted	Solid/powdwr	high

Amounts used

The actual tonnage handled per shift is not considered to influence the exposure as such for this scenario. Instead, the combination of the scale of operation (industrial vs. professional) and level of containment/automation (as reflected in the PROC) is the main determinant of the process intrinsic emission potential.

Frequency and duration	Frequency and duration of use/exposure				
PROC	Duration of exposure				
PROC 4, 5, 8a, 8b, 9, 10, 16, 17, 18, 19, 26	≤ 240 minutes				
PROC 11	≤ 60 minutes				
All applicable PROCs	480 minutes (Not restricted)				
Human factors not infl	luenced by risk management				

The shift breathing volume during all process steps reflected in the PROCs is assumed to be 10 m³/shift (8 hours).

Other given operational conditions affecting workers exposure

Operational conditions like process temperature and process pressure are not considered relevant for occupational exposure assessment of the conducted processes. In process steps with considerably high temperatures (i.e. PROC 22, 23, 25), the exposure assessment in MEASE is however based on the ratio of process temperature and melting point. As the associated temperatures are expected to vary within the industry the highest ratio was taken as a worst case assumption for the exposure estimation. Thus all process temperatures are automatically covered in this exposure scenario for PROC 22, 23 and PROC 25.

Technical conditions and measures at process level (source) to prevent release

Risk management measures at the process level (e.g. containment or segregation of the emission source) are generally not required in the processes.

Technical conditions and measures to control dispersion from source towards the worker

PROC	Level of separation	Localised controls (LC)	Efficiency of LC (according to MEASE)	Further information

PROC 17, 18	workers from the	integrated local exhaust ventilation	87%	-
PROC 19	"Frequency and duration of exposure". A reduction of	not applicable	na	only in well ventilated rooms or outdoors (efficiency 50 %)
All applicable PROCs	exposure duration can be achieved, for example, by the installation of ventilated (positive pressure) control rooms or by removing the worker from workplaces involved with relevant exposure.	not required	na	-

Fibran S.p.A. Via Domenico Fiasella 5/11, 16121 Genova Italy – ph. +39 010 25466.911 fax +39 010 25466.949

Avoid inhalation or ingestion. General occupational hygiene measures are required to ensure a safe handling of the substance. These measures involve good personal and housekeeping practices (i.e. regular cleaning with suitable cleaning devices), no eating and smoking at the workplace, the wearing of standard working clothes and shoes unless otherwise stated below. Shower and change clothes at end of work shift. Do not wear contaminated clothing at home. Do not blow dust off with compressed air.

Conditions and meas	sures related to personal prote	ction, hygiene and	health evaluation	
PROC	Specification of respiratory protective equipment (RPE)	RPE efficiency (assigned protection factor, APF)	Specification of gloves	Further personal protective equipment (PPE)
PROC 9, 26	FFP1 mask	APF=4		Eye protection equipment
PROC 11, 17, 18, 19	FFP3 mask	APF=20	dihydroxide is must be classified as irritating potential of	(e.g. goggles or visors) must be worn, unless
PROC 25	FFP2 mask	APF=10		potential contact with the
All applicable PROCs	FFP2 mask	APF=10		eye can be excluded by the nature and type of application (i.e. closed process). Additionally, face protection, protective clothing and safety shoes are required to be worn as appropriate.

Any RPE as defined above shall only be worn if the following principles are implemented in parallel: The duration of work (compare with "duration of exposure" above) should reflect the additional physiological stress for the worker due to the breathing resistance and mass of the RPE itself, due to the increased thermal stress by enclosing the head. In addition, it shall be considered that the worker's capability of using tools and of communicating are reduced during the wearing of RPE. For reasons as given above, the worker should therefore be (i) healthy (especially in view of medical problems that may affect the use of RPE), (ii) have suitable facial characteristics reducing leakages between face and mask (in view of scars).

and facial hair). The recommended devices above which rely on a tight face seal will not provide the required protection unless they fit the contours of the face properly and securely. The employer and self-employed persons have legal responsibilities for the maintenance and issue of respiratory protective

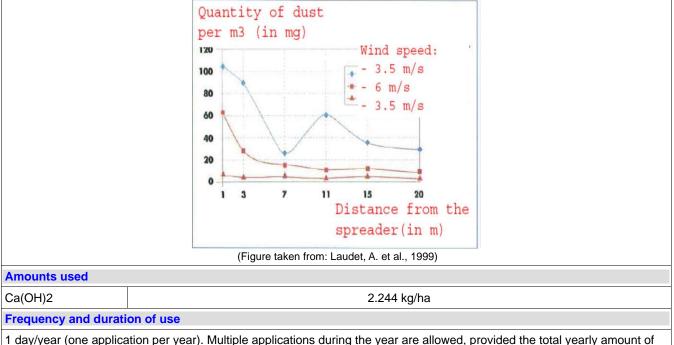

The employer and self-employed persons have legal responsibilities for the maintenance and issue of respiratory protective devices and the management of their correct use in the workplace. Therefore, they should define and document a suitable policy for a respiratory protective device programme including training of the workers.

An overview of the APFs of different RPE (according to BS EN 529:2005) can be found in the glossary of MEASE.

2.2 Control of environmental exposure — only relevant for agricultural soil protection

Product characteristics

Drift: 1% (very worst-case estimate based on data from dust measurements in air as a function of the distance from application)

Fibran S.p.A. Via Domenico Fiasella 5/11, 16121 Genova Italy – ph. +39 010 25466.911 fax +39 010 25466.949

Pag. 15 of 22

Technical conditions and measures at process level (source) to prevent release

Lime is only applied onto the soil in the technosphere zone before road construction. There are no direct releases to adjacent surface waters.

Technical onsite conditions and measures to reduce or limit discharges, air emissions and releases to soil

Drift should be minimised.

3. Exposure estimation and reference to its source

Occupational exposure

The exposure estimation tool MEASE was used for the assessment of inhalation exposure. The risk characterisation ratio (RCR) is the quotient of the refined exposure estimate and the respective DNEL (derived no-effect level) and has to be below 1 to demonstrate a safe use. For inhalation exposure, the RCR is based on the DNEL for calcium dihydroxide of 1 mg/m³ (as respirable dust) and the respective inhalation exposure estimate derived using MEASE (as inhalable dust). Thus, the RCR includes an additional safety margin since the respirable fraction being a sub-fraction of the inhalable fraction according to EN 481.

PROC	Method used for inhalation exposure assessment	inhalation exposure estimate (RCR)	Method used for dermal exposure assessment	Dermal exposure estimate (RCR)
PROC 2, 3, 4, 5, 8a, 8b, 9, 10, 11, 13, 15, 16, 17, 18, 19, 25, 26	MEASE	< 1 mg/m³ (0,5 - 0,825)	irritating to skin, dern minimised as far as DNEL for dermal effec	roxide is classified as hal exposure has to be technically feasible. A ts has not been derived. e is not assessed in this

Environmental exposure for agricultural soil protection

The PEC calculation for soil and surface water was based on the FOCUS soil group (FOCUS, 1996) and on the "draft guidance on the calculation of predicted environmental concentration values (PEC) of plant protection products for soil, ground water, surface water and sediment (Kloskowksi et al., 1999). The FOCUS/EXPOSIT modelling tool is preferred to the EUSES as it is more appropriate for agricultural-like application as in this case where parameter as the drift needs to be included in the modelling. FOCUS is a model typically developed for biocidal applications and was further elaborated on the basis of the German EXPOSIT 1.0 model, where parameters such as drifts can be improved according to collected data: once applied on the soil, calcium dihydroxide can indeed migrate then towards surface waters, via drift.

Environmental emissions	See amounts used					
Exposure concentration in waste water treatment plant (WWTP)	Not relevant for agricultural soil protection					
Exposure	Substance	PEC (ug/l)	PNEC (ug/l)	RCR		
concentration in aquatic pelagic compartment	Ca(OH)2 7,48 490 0,015					
Exposure concentration in sediments	As described above, no exposure of surface water nor sediment to lime is expected. Further, in natural waters the hydroxide ions react with HCO3- to form water and CO32 CO32- forms CaCO3 by reacting with Ca2+. The calcium carbonate precipitates and deposits on the sediment. Calcium carbonate is of low solubility and a constituent of natural soils.					
Exposure	Substance	PEC (ug/l)	PNEC (ug/l)	RCR		
concentrations in soil and groundwater	Ca(OH)2	660	1080	0,61		
Exposure concentration in atmospheric compartment	This point is not relevant. Calcium dihydroxide is not volatile. The vapour pressures is below 10–5 Pa.					
Exposure concentration relevant for the food	This point is not relevant beca environment. The uses cover (Ca2+ and OH-) in the enviro	ed do not significantly i				

Fibran S.p.A. Via Domenico Fiasella 5/11, 16121 Genova Italy - ph. +39 010 25466.911 fax +39 010 25466.949

chain	(secondary
poisor	ning)

Environmental exposure for soil treatment in civil engineering

The soil treatment in civil engineering scenario is based on a road border scenario. At the special road border technical meeting (Ispra, September 5, 2003), EU Member States and industry agreed on a definition for a "road technosphere". The road technosphere can be defined as "the engineered environment that carries the geotechnical functions of the road in connection with its structure, operation and maintenance including the installations to ensure road safety and manage run off. This technosphere, which includes the hard and soft shoulder at the edge of the carriageway, is vertically dictated by the groundwater watertable. The road authority has responsibility for this road technosphere including road safety, road support, prevention of pollution and water management". The road technosphere was therefore excluded as assessment endpoint for risk assessment for the purpose of the existing/new substances regulations. The target zone is the zone beyond the technosphere, to which the environmental risk assessment applies.

The PEC calculation for soil was based on the FOCUS soil group (FOCUS, 1996) and on the "draft guidance on the calculation of predicted environmental concentration values (PEC) of plant protection products for soil, ground water, surface water and sediment (Kloskowksi et al., 1999). The FOCUS/EXPOSIT modelling tool is preferred to the EUSES as it is more appropriate for agricultural-like application as in this case where parameter as the drift needs to be included in the modelling. FOCUS is a model typically developed for biocidal applications and was further elaborated on the basis of the German EXPOSIT 1.0 model, where parameters such as drifts can be improved according to collected data.

Environmental emissions	See amounts used					
Exposure concentration in waste water treatment plant (WWTP)	Not relevant for road border scenario					
Exposure concentration in aquatic pelagic compartment	Not relevant for road bor	rder scenario				
Exposure concentration in sediments	Not relevant for road bor	rder scenario				
Exposure	Substance	PEC (ug/l)	PNEC (ug/l)	RCR		
concentrations in soil and groundwater	Ca(OH)2	701	1080	0,65		
Exposure concentration in atmospheric compartment	This point is not relevant. Calcium dihydroxide is not volatile. The vapour pressures is below 10–5 Pa					
Exposure concentration relevant for the food chain (secondary poisoning)	This point is not relevant because calcium can be considered to be omnipresent and essential in the environment. The uses covered do not significantly influence the distribution of the constituents (Ca2+ and OH-) in the environment.					
Environmental exposu	ire for other uses					
	antitative environmental enditions and risk manage			tlined for agricultural soil		

The operational conditions and risk management measures are less stringent than those outlined for agricultural soil
protection or soil treatment in civil engineering.

- Lime is an ingredient and chemically bound into a matrix. Releases are negligible and insufficient to cause a pH-shift in soil, wastewater or surface water

- Lime is specifically used to release CO2-free breathable air, upon reaction with CO2. Such applications only relates to the air compartment, where the lime properties are exploited

- Neutralisation/pH-shift is the intended use and there are no additional impacts beyond those desired.

Fibran S.p.A. Via Domenico Fiasella 5/11, 16121 Genova Italy - ph. +39 010 25466.911 fax +39 010 25466.949

Pag. 17 of 22

4. Guidance to DU to evaluate whether he works inside the boundaries set by the ES

The DU works inside the boundaries set by the ES if either the proposed risk management measures as described above are met or the downstream user can demonstrate on his own that his operational conditions and implemented risk management measures are adequate. This has to be done by showing that they limit the inhalation and dermal exposure to a level below the respective DNEL (given that the processes and activities in question are covered by the PROCs listed above) as given below. If measured data are not available, the DU may make use of an appropriate scaling tool such as MEASE (www.ebrc.de/mease.html) to estimate the associated exposure. The dustiness of the substance used can be determined according to the MEASE glossary. For example, substances with a dustiness less than 2.5 % according to the Rotating Drum Method (RDM) are defined as "low dusty", substances with a dustiness less than 10 % (RDM) are defined as "medium dusty" and substances with a dustiness with a dustines with a dustines with a dustiness with a dustines

DNEL_{inhalation}: 1 mg/m³ (as respirable dust)

<u>Important note</u>: The DU has to be aware of the fact that apart from the long-term DNEL given above, a DNEL for acute effects exists at a level of 4 mg/m³. By demonstrating a safe use when comparing exposure estimates with the long-term DNEL, the acute DNEL is therefore also covered (according to R.14 guidance, acute exposure levels can be derived by multiplying longterm exposure estimates by a factor of 2). When using MEASE for the derivation of exposure estimates, it is noted that the exposure

Not relevant for exposure assessment

3. Exposure estimation and reference to its source

The risk characterisation ratio (RCR) is the quotient of the refined exposure estimate and the respective DNEL (derived noeffect level) and is given in parentheses below. For inhalation exposure, the RCR is based on the acute DNEL for lime substances of 4 mg/m3 (as respirable dust) and the respective inhalation exposure estimate (as inhalable dust). Thus, the RCR includes an additional safety margin since the respirable fraction is a sub-fraction of the inhalable fraction according to EN 481. Since limes are classified as irritating to skin and eyes a qualitative assessment has been performed for dermal exposure and exposure to the eye.

Human exposure

Handling of powder Route of Exposure estimate Method used, comments exposure Oral Qualitative assessment Oral exposure does not occur as part of the intended product use Dermal small task: 0.1 µg/cm² (-) Qualitative assessment large task: 1 µg/cm² (-) If risk reduction measures are taken into account no human exposure is expected. However, dermal contact to dust from loading of lime substances or direct contact to the lime cannot be excluded if no protective gloves are worn during application. This may occasionally result in mild irritation easily avoided by prompt rinsing with water. Quantitative assessment The constant rate model of ConsExpo has been used. The contact rate to dust formed while pouring powder has Qualitative assessment Eye Dust If risk reduction measures are taken into account no human exposure is expected. Dust from loading of the lime substances cannot be excluded if no protective goggles are used. Prompt rinsing with water and seeking medical advice after accidental exposure is advisable. Quantitative assessment Inhalation Small task: 12 µg/m³ (0.003) Large task: 120 µg/m3 (0.03) Dust formation while pouring the powder is addressed by using the dutch model (van Hemmen, 1992, as described in section 9.0.3.1 above).

Application of liquid, pasty lime preparations.

Route of	Exposure estimate	Method used, comments
exposure	Exposure estimate	
Oral	-	Qualitative assessment Oral exposure does not occur as part of the intended product use.
Dermal	Splashes	Qualitative assessment If risk reduction measures are taken into account no human exposure is expected. However, splashes on the skin cannot be excluded if no protective gloves are worn during the application. Splashes may occasionally result in mild irritation easily avoided by immediate rinsing of the hands with water.
Eyes	Splashes	Qualitative assessment If appropriate goggles are worn no exposure to the eyes needs to be expected. However, splashes into the eyes cannot be excluded if no protective goggles are worn during the application of liquid or pasty lime preparations, especially during overhead work. Prompt rinsing with water and seeking medical advice after accidental exposure is advisable.
Inhalation	-	Qualitative assessment Not expected, as the vapour pressure of limes in water is low and generation of mists or aerosols does not take place.

Post-application exposure

No relevant exposure will be assumed as the aqueous lime preparation will quickly convert to calcium carbonate with carbon dioxide from the atmosphere.

Environment exposure

Referring to the OC/RMMs related to the environment to avoid discharging lime solutions directly into municipal wastewater, the pH of the influent of a municipal wastewater treatment plant is circum-neutral and therefore, there is no exposure to the biological activity. The influent of a municipal wastewater treatment plant is often neutralized anyway and lime may even be used beneficially for pH control of acid wastewater streams that are treated in biological WWTPs. Since the pH of the influent of the municipal treatment plant is circum neutral, the pH impact is negligible on the receiving environmental compartments, such as surface water,
